Warnings, Cautions and Notes
Pay special attention to information provided in warnings, cautions, and notes, that is accompanied by these symbols:

⚠️ WARNING ⚠️
A WARNING indicates a procedure or situation that, if not avoided, could result in serious injury or death to the user.

⚠️ CAUTION ⚠️
A CAUTION indicates any situation or technique that could cause damage to the product, and could subsequently result in injury to the user.

⚠️ NOTE ⚠️
A NOTE is used to emphasize important points, tips, and reminders.

⚠️ WARNING ⚠️
This manual provides essential instructions for the proper setup, inspection, use, and care of your new regulator. Because Sea Quest regulators utilize patented technology, it is very important to take the time to read these instructions in order to understand and fully enjoy the features that are unique to your specific model. Improper use of your regulator could result in serious injury or death.

GENERAL PRECAUTIONS & WARNINGS

Before using this regulator, you must receive instruction and certification in SCUBA diving from a recognized training agency (or any U.S. Military or government operated diving school). Use of SCUBA equipment by uncertified or untrained persons is dangerous and can result in injury or death.

This regulator is not configured for commercial use with surface supplied air.

Always pressurize the regulator gradually by opening the cylinder valve SLOWLY.

NEVER apply any type of lubricant to any part of the regulator or cylinder valve.

DO NOT apply any type of aerosol spray to the regulator. Doing so may cause permanent damage to certain plastic components, including the second stage housing.

Factory prescribed service for this regulator must be performed at least once annually by a factory trained Sea Quest service technician who is employed by an Authorized Sea Quest Dealer. Disassembly, repair, or first stage adjustment must not be attempted by persons who are not factory trained and authorized by Sea Quest.

DO NOT leave a cylinder standing unsecured with the regulator attached to the valve. Doing so may cause permanent damage to the regulator and cylinder valve if the cylinder falls over.

DO NOT carry the regulator by the first stage when it is connected to a cylinder. Always carry the cylinder by the cylinder valve or an attached carrying device.

When diving in cold water (below 45°F, or 7°C), you must have received training and certification in the techniques of cold water diving from a recognized training agency.

This regulator is designed and intended for use only with clean, compressed atmospheric air (21% oxygen and 79% nitrogen), meeting the requirements of the EN 132 standard, appendix A. DO NOT use this equipment with any other gas or enriched oxygen mixture above 23% oxygen. Failure to observe this warning may result in serious injury or death due to fire or explosion.
Congratulations—and thank you—for choosing Sea Quest. Your new regulator has been designed and manufactured with pride, according to the most exacting standards for quality and performance.

Provided that it has been purchased new from an Authorized Sea Quest Dealer, your regulator is covered by Sea Quest’s Limited Lifetime Warranty. Be sure to read the warranty section of this manual completely and remember to save your sales receipts. Copies of these receipts must be presented whenever obtaining warranty service.

Perhaps more than any other piece of diving equipment you will own, your regulator’s function and performance relies greatly on the care and maintenance it will receive, in addition to regularly scheduled dealer service. Before you dive with your new Sea Quest regulator, it is therefore important to read this manual in its entirety to become familiar with its features, as well as the correct procedures for setup, pre-dive inspection, and post-dive maintenance.

Please read on to learn how you can obtain the maximum enjoyment from your regulator, and maintain its like-new performance for many years to come.

If you have any questions regarding this regulator or these instructions, contact your Sea Quest retailer or Sea Quest at:

(760) 727-8488
OVERVIEW OF FEATURES

The Sea Quest family of regulators consists of different models which satisfy a wide range of diving interests; from entry level sport diving, to advanced diving in more demanding and extreme conditions. By now, your Authorized Sea Quest Dealer has already explained to you the specific features that your particular model offers, and you have made your purchase after comparing the benefits of these features to your individual diving needs and interests. Be sure to review this section to learn more about your model’s features and how to obtain the maximum benefit from using them.

External Second Stage Adjustments (XR2 second stage only)

External adjustment features offer you the advantage of being able to adjust your second stage regulator’s sensitivity to suit your preference as your diving conditions change. The XR2 second stage is equipped with two different adjustments, including an Inhalation Control Knob and a Venturi Assist Switch (see Fig. 1).

Venturi Assist Switch (Fig. 2)

The venturi assist switch is located on the top of the XR2 second stage, in front of the mouthpiece, and helps to maintain a high flow of air once you have started to take a breath.

When the switch is set to the “MAX” position, the regulator will provide maximum venturi assistance. This makes it easier to breathe at deeper depths and increased work loads.

For normal sport diving conditions, the regulator will perform suitably if the switch is left set to the “MIN” position. This setting will also help to prevent the second stage from freeflowing during entry or while swimming on the surface.
Inhalation Control Knob (Fig. 3)

The inhalation control knob, located opposite of the hose connection on the XR2 second stage, adjusts the effort required to start the air flow at the beginning of the inhalation cycle. As it is turned “in” (clockwise), the opening effort will increase. This will make the second stage less sensitive to sudden changes in ambient pressure. Turning the knob “out” (counter-clockwise) will decrease the opening effort to make breathing easier.

This adjustment is particularly useful at deeper depths, or in variable conditions that affect the opening effort of the second stage, such as strong currents or while using a diver propulsion vehicle (DPV). You can use the inhalation control knob to tune your regulator to maintain its peak performance throughout the course of your dive, or you can leave it set in its mid-range position and dive with it as you would any non-adjustable second stage.

For more information on using the XR2 second stage adjustments underwater, refer to the section titled, Diving With the XR2.

First Stage Environmental Protection

For diving in cold water conditions or heavily silted water, Sea Quest offers three optional environmental protection kits for the Infinity, Mirage, and Spectrum first stages, which must be installed by your Authorized Sea Quest Dealer. Each of these kits is designed to seal the first stage from the environment, thereby preventing the entrance of any silt or cold water. It is important to remember, however, that this environmental protection will only prevent ice from forming in the first stage ambient chamber, and will not prevent the second stage from icing or freezing.

The kits for the Infinity and Mirage, which are both piston design first stages, contain silicone gel that fills the ambient chamber to completely surround the piston and valve spring. A protective cap or sleeve is then installed over the ports of the ambient chamber to retain this transfer medium (see Fig. 3).
The Spectrum first stage, which features a balanced diaphragm design, uses a special "DRY" environmental protection kit. The DRY kit also seals off the ambient chamber with an external diaphragm, but incorporates a specially designed piston to transfer the surrounding water pressure to the internal diaphragm, instead of a silicone medium.

"Cryo" Cold Water Second Stage

The XR2 regulator is also available in a cold water version; the XR2 Cryo, which includes the Spectrum DRY first stage. This model features a patented heat exchange system that effectively reduces the possibility of second stage freezeup by drawing in the surrounding water temperature to warm the valve mechanism (see Fig. 5). Standard XR2 regulators can be upgraded to the Cryo version by your Authorized Sea Quest Dealer.

For important information about diving in cold water, refer to the section titled, Cold Water Diving.

Optional DIN Adapter (Spectrum & Mirage Only)

Your Sea Quest regulator is sold with a standard U.S. yoke connection, which is approved for use with cylinder pressures up to 3,000 psi. If you intend to use your regulator with a high pressure cylinder equipped with a DIN valve, a DIN adapter is available separately for the Spectrum or Mirage first stage which can be purchased from and installed by your Authorized Sea Quest Dealer (see Fig. 6).

**CAUTION**

Installation of a first stage DIN adapter must only be performed by an Authorized Sea Quest Dealer, and must not be attempted by unauthorized individuals. Failure to obtain this service through an Authorized Sea Quest Dealer may result in faulty installation, and could lead to severe injury or death.
PREPARATION AND SETUP

Sea Quest recommends that you bring your regulator to your Authorized Sea Quest Dealer for the installation of any accessory items, including instrumentation, LP quick disconnect hoses, and alternate air source second stages. Your dealer can also answer any questions you may have pertaining to the information in this manual.

1. (XR2 second stage only) Check the venturi assist switch on the top of the second stage to ensure that it is set to the “MIN” position prior to connecting your regulator to the tank.

2. (XR2 second stage only) If the inhalation control knob has been turned “out” (counter-clockwise), gently turn it “in” (clockwise), only until it stops. Do not apply excessive pressure.

3. If you are using a standard cylinder with a yoke connector valve, inspect the cylinder valve O-ring for any wear or damage. If you are using a high pressure cylinder with a DIN valve, remove the protector cap from the first stage to inspect the sealing O-ring of the DIN connector. If the sealing O-ring is damaged or worn, replace it before mounting the regulator on the cylinder valve.

Mounting the First Stage Onto the Cylinder Valve (Yoke Connector)

1. Partially unscrew the yoke screw of the first stage regulator so that the dust cap can be removed from the filter and air inlet.

2. With the cylinder valve facing away from you, release a small amount of air from the cylinder by turning the handwheel counter-clockwise to open the valve only slightly. When air is heard exiting, immediately close the valve. This will clear any moisture or debris that may be inside the cylinder valve outlet opening.

3. Place the first stage regulator over the cylinder valve so that the inlet fitting aligns with the O-ring of the cylinder valve, and the LP hose of the primary second stage will be routed over the right shoulder. While holding the first stage in place, turn the yoke screw clockwise. Ensure that the yoke screw mates into the small dimple on the backside of the cylinder valve, and tighten finger-tight only.

4. If a submersible pressure gauge is attached to the first stage, ensure that the gauge is facing away from you. Pressurize the regulator by slowly turning the cylinder valve handwheel counter-clockwise. Continue to turn the valve handwheel counter-clockwise until it is fully open, and then turn it back clockwise ¼-½ turn.
5. Listen near the first stage to check for any leakage. If leakage is detected, immerse the first stage and cylinder valve while pressurized to determine the source.

6. If leakage has been detected, follow the procedure for removing the regulator from the cylinder valve on page 13. If air was leaking between the first stage and cylinder valve, replace or re-seat the cylinder valve O-ring as needed and repeat the above procedure. If leakage persists, return the cylinder and regulator to an Authorized Sea Quest Dealer.

**Mounting the First Stage Onto the Cylinder Valve (DIN Connector)**

1. Remove the protector cap from the cylinder valve. With the cylinder valve facing away from you, release a small amount of air from the cylinder by turning the handwheel counter-clockwise to open the valve slightly. When air is heard exiting, immediately close the valve. This will clear any moisture or debris that may be inside the threaded cylinder valve opening.

2. Position the first stage near the cylinder valve so that the LP hose of the primary second stage will be routed over the right shoulder. Thread the first stage DIN connector into the cylinder valve and turn the handwheel clockwise by hand until it is lightly snug. DO NOT use tools to tighten.

3. If a submersible pressure gauge is attached to the first stage, ensure that the gauge is facing away from you. Pressurize the regulator by slowly turning the cylinder valve handwheel counter-clockwise. Continue to turn the cylinder valve handwheel counter-clockwise until fully open, and then back clockwise ¼-½ turn.

4. Listen near the first stage to check for any leakage. If leakage is detected, immerse the first stage while pressurized to determine the source.

5. If leakage has been detected, follow the procedure for removing the regulator from the cylinder valve on page 13. If air was leaking between the first stage and cylinder valve, replace or re-seat the cylinder valve O-ring as needed and repeat the above procedure. If leakage persists, return the cylinder and regulator to an Authorized Sea Quest Dealer.
PRE-DIVE INSPECTION

Before each use, the regulator must be given a thorough visual inspection and functional test. NEVER dive with a regulator that shows signs of damage or unsatisfactory performance until it has received complete inspection and service from an Authorized Sea Quest Dealer.

Inspection Checklist:

1. Carefully inspect all hoses at their fittings to ensure they are securely connected into their respective ports on the first stage. Inspect the length of each hose to ensure that the hoses are not blistered, cut, or otherwise damaged. If hose protectors are present, slide the protectors back to expose the hose fittings, and inspect the hoses as described above.

2. Visually inspect both the first and second stage regulators for any signs of external damage.

3. Remove the dust cap and closely inspect the condition of the first stage filter. It should appear clean and free of any corrosion or discoloration. If a green residue is visible on the surface of the filter, moisture has entered the first stage and may have caused corrosion to begin forming inside which can seriously impair the regulator’s performance. Other colored residue may indicate that the regulator has been used with an internally corroded aluminum (white/gray powder) or steel (rust) cylinder. In this event, the regulator and the cylinder in question should be returned to the dive store for internal visual inspection.

4. (Environmentally sealed first stages only) Closely inspect the external sealing diaphragm or protective cap for any signs of damage or deterioration that may cause leakage. For the Spectrum "DRY," the retainer that holds the external diaphragm in place must be tightly secured.

CAUTION

If discoloration or contaminant residue is found to be present on the surface of the filter, it is strongly recommended that you DO NOT attempt to dive with the regulator until it has received factory prescribed service from an Authorized Sea Quest Dealer.
If the environmental kit shows any signs of damage or neglect, DO NOT attempt to dive with the regulator until it has received factory prescribed service from an Authorized Sea Quest Dealer. Under this condition, the regulator may seem to function normally at the surface, but may not provide adequate airflow at depth. The environmental protection may also be compromised, and could result in first stage freeze-up in cold water conditions.

5. Connect the first stage regulator to a fully charged SCUBA cylinder. For mounting instructions, read the Setup section on page 7.

6. SLOWLY open the cylinder valve to pressurize the regulator. Depress the purge button momentarily to blow out any dust or debris which may have entered the second stage.

7. Release the purge button and listen to ensure that the second stage does not continue to flow any air after the purge button is released.

8. (XR2 second stage only) Turn the inhalation control knob “out” (counter-clockwise) until a slight leak is heard, and then back "in" (clockwise) until the regulator provides maximum ease of breathing with no leakage present. Do not apply excessive pressure.

9. Inhale slowly and deeply from the regulator several times. The regulator must deliver enough air for you to breathe easily without noticeable resistance.

10. Check to ensure that the submersible pressure gauge is displaying an accurate measurement of the air pressure inside the cylinder.

11. Close the cylinder valve and bleed the air from the regulator by pressing the purge button. Look at the submersible pressure gauge, or your dive computer if it is air integrated. The air pressure reading must fall to zero. If you are not certain the gauge or computer is reading correctly, do not dive with the system until it has received inspection and service from an Authorized Sea Quest Dealer.

12. (XR2 second stage only) Check to ensure that the venturi assist switch is set to “MIN” and gently turn the inhalation control knob back “in” (clockwise), only until it stops. Do not apply excessive pressure. These settings will help to minimize any loss of your air supply during entry or while making a long surface swim.

13. Before entering the water, turn the cylinder valve completely open and then back ¼-½ turn to ensure that the regulator is pressurized.
DIVING IN COLD WATER

Before attempting an unsupervised dive in cold water conditions, it is important for you and your buddy to obtain certified training in cold water diving techniques, and to ensure that your breathing systems are properly equipped for this diving specialty. If these precautions are not taken, freeze-up can occur, especially in fresh water lakes where thermoclines may be encountered.

After receiving training, you should bring your regulator to an Authorized Sea Quest Dealer for inspection and any service that may be needed. Your regulator may require the installation of additional parts that will render it more suitable for cold water use, or you may be advised to purchase a different model that is better designed for this purpose.

It is possible for icing or freeze-up to occur, even with a regulator that has been specially designed and/or prepared for cold water use. For this reason, it is imperative that you must practice the correct cold water diving procedures, and take special precautions to prevent second stage icing. This training must include procedures for dealing with regulator freeze-up, unexpected freeflow, and emergency out-of-air situations. These procedures are taught in cold water training programs provided by most recognized certification agencies.

Whenever your air cylinder is filled, request verification that the water vapor content of the supplied air is less than -65°F dewpoint. (Most dive stores and air stations obtain regular testing and certification to provide evidence of compliance with pure air standards.) Excess water vapor in the air can cause moving parts inside your regulator to ice-up and freeze.

**WARNING**

SCUBA regulators and other equipment have operational limits when used in water colder than 45°F (7°C). If you attempt to dive in cold water without first obtaining the necessary training and preparation of your equipment, you risk serious injury and death.
DIVING WITH THE XR2 ADJUSTABLE SECOND STAGE

When you are ready to submerge, turn the inhalation control knob on the left side of the XR2 second stage all the way “out” (counter-clockwise). Then, turn the knob back “in” (clockwise) until the regulator breathes comfortably without leaking or being undesirably sensitive.

For XR2 regulators sold in the United States, it is normal for the second stage to continuously leak air when the inhalation control knob is turned all the way “out” (counter-clockwise), in order to provide the maximum range of adjustment.

As you descend, you may want to turn the regulator knob further out to make breathing easier. This will be particularly true on deep dives where the air becomes denser. Remember, however, that the regulator may continuously leak air if the inhalation control knob is turned completely “out,” and that this will cause the air supply to be depleted more rapidly.

Adjusting your regulator to increase breathing resistance will not conserve air. Instead, excessive breathing resistance will actually increase air consumption, and may elevate the CO2 in your bloodstream to a dangerous level which could lead to serious injury or death due to drowning if you lose consciousness.

If you swim underwater in an upside down or sideways position, or facing a strong current, you can turn the inhalation control knob back “in” (clockwise), to desensitize the opening effort to prevent any freeflow.

If you turned the venturi assist switch to the “MAX” position at any time during your dive, be sure to return it to the “MIN” position when you ascend to the surface, and also turn the inhalation control knob “in.”

Deep diving requires special training and equipment, and greatly increases your risk of decompression sickness and other serious diving injuries. If you attempt to dive beyond prescribed no-decompression limits without first obtaining sanctioned technical dive training, you risk serious injury and death.
After the Dive

If fresh water is available, rinse your regulator completely before depressurizing it, and thoroughly dry the first stage and cylinder valve with a soft cloth. This will help to prevent any contaminants from entering the regulator when it is removed from the cylinder.

Removal of the Regulator from the Cylinder Valve (Yoke Connector)
1. Shut off the cylinder air supply by turning the cylinder valve handwheel clockwise until it stops.
2. While observing the submersible pressure gauge, depress the purge button of the second stage. When the gauge reads zero and airflow cannot be heard from the second stage, release the purge button.
3. Turn the yoke screw counter-clockwise to loosen and remove the first stage from the cylinder valve.
4. Dry the dust cap with a clean towel, or with low pressure air. Be careful to avoid blowing out the dust cap O-ring and losing it.
5. Place the dust cap over the first stage inlet fitting and seal it securely in place by tightening down the yoke screw.

Removal of the Regulator from the Cylinder Valve (DIN Connector)
1. Turn off the cylinder air supply by turning the cylinder valve handwheel clockwise until it stops.
2. While observing the submersible pressure gauge, depress the purge button of the second stage. When the gauge reads zero and airflow cannot be heard from the second stage, release the purge button.
3. Turn the first stage handwheel counter-clockwise to loosen and remove the first stage from the cylinder valve.
4. Blow out any water inside the protector cap or wipe it out with a soft cloth, and wipe the threads of the first stage connector clean and dry. Install the cap over the threads of the first stage connector.

Be careful when removing the first stage from the cylinder valve to ensure that moisture does not enter either the inlet opening of the first stage or the opening of the DIN valve.
5. With the cylinder valve facing away from you, open the valve slightly to release a short burst of air, and then immediately close the valve. This will clear any moisture that may have entered the valve opening. Immediately seal the protector cap securely in place over the opening of the DIN valve to prevent the entrance of moisture or debris.

**USER CARE & MAINTENANCE**

It is important to provide the proper preventative maintenance in order to ensure the best possible performance and maximum life of your Sea Quest Regulator. The following maintenance procedures should be performed routinely after each use to ensure that the regulator is cleaned, inspected, and prepared for the next use or for storage.

1. Whenever the regulator is removed from the cylinder valve, it is important to wipe or blow the dust cap completely dry, and then fasten it securely over the first stage inlet fitting. This is critical to prevent the entrance of moisture into the first stage. Check to ensure that the O-ring is seated securely inside the dust cap.

2. As soon as possible after diving, the regulator should be rinsed thoroughly with fresh water while it is attached to a cylinder and pressurized with air.

3. Rinsing alone, however, will not sufficiently clean the regulator. To clean the regulator as thoroughly as possible, it is necessary to soak it in warm (not over 120°F) tap water for at least one hour.

   a. The preferred method is to attach the regulator to a charged SCUBA cylinder, open the cylinder valve to pressurize the regulator, and thoroughly soak both the first and second stages. Pressurizing the regulator will effectively prevent the entrance of moisture and/or contaminants into the regulator while it soaks.

   b. If it is not feasible to soak the regulator while it is attached to a cylinder, it may be soaked unpressurized – provided that the dust cap is securely sealed over the inlet with its O-ring intact, and the second stage purge buttons are not depressed while the regulator is submerged or wet.

   △ **NOTE**

   When soaking or rinsing an adjustable model regulator unpressurized, check to ensure that the second stage inhalation control knob is turned completely “in” (clockwise) to prevent moisture from entering the valve and LP hose.
DO NOT loosen the first stage yoke screw, depress the second stage purge button, or turn the inhalation control knob out (XR2 model) if the regulator is submerged unpressurized. Doing so will allow the entrance of moisture, and will require that the regulator be returned to an Authorized Sea Quest Dealer for service.

4. (XR2 second stage only) While the regulator is soaking, move the venturi assist switch on the second stage (if present) back and forth several times from the “MIN” to the “MAX” settings. You may also turn the inhalation control knob slightly back and forth—no more than $\frac{1}{4}$ turn. This action will help to loosen any salt or mineral deposits that may remain lodged in the second stage.

5. After the regulator has been properly soaked, it is important to rinse it vigorously by flushing the first stage ambient chamber (non-environmentally sealed models only), the second stage mouthpiece, and the openings in the second stage front cover with a pressurized stream of water. This will remove any deposits of salt and minerals that were loosened during soaking. If the regulator is not pressurized, do not press the purge button underwater. Moisture may otherwise enter the valves, which will require that the regulator be returned to an Authorized Sea Quest Dealer for service.

6. Wipe the regulator as dry as possible and hang by the first stage to ensure that all remaining moisture drains from the second stages.

7. XR2 second stages should be stored with the knob turned all the way out (counter-clockwise), away from the regulator body. This will help to extend the life of the low pressure seat.

8. When the regulator is completely dry, store it in a clean box or sealed inside a plastic bag. Do not store it where it may be exposed to extreme heat or an electric motor which produces ozone. Prolonged exposure to extreme heat, ozone, chlorine, and ultraviolet rays can cause premature degradation of rubber parts and components.

9. Never store the regulator while it is connected to the cylinder valve.

10. Do not use any type of solvent or petroleum based substances to clean or lubricate any part of the regulator. Do not expose any part of the regulator to aerosol spray, as some aerosol propellants attack or degrade rubber and plastic materials.
DEALER SERVICE & REPAIR

1. It cannot be assumed that a regulator is in good working order on the basis that it has received little use since it was last serviced. Remember that prolonged or improper storage can still result in internal corrosion and/or deterioration of O-ring seals.

2. You must obtain factory prescribed service for your regulator at least once a year from an Authorized Sea Quest Dealer, regardless of the amount of use it has received. Your regulator may require this service more frequently, depending on the amount of use it receives and the environmental conditions in which it is used.

3. If the regulator is used for rental or training purposes, it will require complete overhaul and factory prescribed service every three to six months. Chlorinated swimming pool water is an especially damaging environment for SCUBA equipment, due to the high levels of chlorine and pH balancing chemicals which cause certain components to rapidly deteriorate.

4. DO NOT attempt to perform any disassembly or service of your regulator. Doing so may cause the regulator to malfunction, and will render the Sea Quest warranty null and void. All service must be performed by an Authorized Sea Quest Dealer.

OBTAIN SERVICE FOR YOUR REGULATOR AT LEAST ONCE A YEAR, FROM AN AUTHORIZED SEA QUEST DEALER. YOUR PERSONAL SAFETY AND THE MECHANICAL INTEGRITY OF YOUR REGULATOR MAY DEPEND ON IT.
NOTE: To validate your warranty, please complete and return the enclosed warranty registration card within 15 days of purchase.

WARRANTY INFORMATION

All warranty transactions must be accompanied by proof of original purchase from an Authorized Sea Quest Dealer. Be sure to save your sales receipt, and present it whenever returning your regulator for warranty service.

Limited Lifetime Warranty

Sea Quest warrants to the original purchaser that the product will remain free from defects in material and workmanship throughout its useful life; provided that it receives normal use, proper care, and prescribed dealer service subject to those restrictions stated below.

This warranty does not apply to units subjected to misuse, abuse, neglect, modification, or unauthorized service.

This limited warranty is extended only to the original purchaser for products purchased directly from an Authorized Sea Quest Dealer, and is not transferable.

This warranty is limited to repair or replacement only at the discretion of Sea Quest.

WARNING

It is dangerous for untrained and uncertified persons to use the equipment covered by this warranty. Therefore, use of this equipment by an untrained person renders any and all warranties null and void. Use of SCUBA equipment by anyone who is not a trained and certified diver, or receiving training under the supervision of an instructor, could lead to serious injury or death.

This warranty gives you specific legal rights. You may have rights which vary from state to state and country to country.

SEA QUEST DISCLAIMS AND EXCLUDES ANY LIABILITY FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES. SOME STATES IN THE U.S. AND CERTAIN FOREIGN COUNTRIES DO NOT ALLOW EXCLUSIONS OR LIMITATIONS OF LIABILITY FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES, SO THIS MAY NOT APPLY TO YOU.
Restrictions
The following restrictions apply to this warranty:
1. This warranty does not cover normal wear. Factory prescribed service by an Authorized Sea Quest Dealer is required at least once annually.
2. This warranty does not extend to damages caused by improper use, improper maintenance, neglect, unauthorized repairs, modifications, accidents, fire, or casualty.
3. Cosmetic damage, such as scratches, dents, and nicks are not covered by this warranty.
4. This warranty does not extend to equipment used for rental, commercial, or military purposes.
5. This warranty covers products purchased in the USA. For warranties that may apply elsewhere, please contact your local representative.

Returning Your Regulator For Service
Whenever your regulator requires annual service or warranty repair, Sea Quest recommends that you bring it to an Authorized Sea Quest Dealer.

If you need to return products for service, follow these steps:
1. Provide the dealer with photocopies of your original sales receipt and service records if the product is more than one year old.
2. If you intend to ship directly to Sea Quest for warranty service, you must first obtain a Return Merchandise Authorization (RMA) number from the factory by calling 1-760-727-8488.
3. Write the RMA number on the address label. This is important.
4. Send photocopies of your original sales and service receipts, along with the product and a letter detailing the problem as precisely as possible. Include your name, address, and daytime telephone number in the letter.
5. Ship the package to:

    Sea Quest
    2340 Cousteau Court
    Vista, CA  92083
    Attention: Repair Dept.

    You must prepay all freight charges. Sea Quest does not accept C.O.D. shipments.

Beware of any retailer that offers to sell and ship our life supporting products by mail, for orders placed by phone or the Internet. These retailers are NOT authorized Sea Quest Dealers. All authorized Sea Quest Dealers must execute a Dealer Agreement that does not allow the sale of Sea Quest products except "in-store." Many Sea Quest dealers advertise on the Internet, but they are not allowed to deliver our products other than "over-the-counter." This is our assurance that you will receive the proper pre-sale, point-of-sale, and post-sale assistance, and that only trained and certified divers will use our products.

If you obtain our product from one of these retailers, your warranty is therefore not valid and we cannot offer you the assurances of quality and satisfaction afforded by the Sea Quest Warranty Program. If you would like to verify whether or not a retailer is an authorized Sea Quest Dealer, please call:

1-(760) 597-5000
